/note="Vector: lambda 2ip-Lox; Site_1: Sal; Site_2: Not;
Lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark-rosettes; 4)
same plants as 3 but acrial tissue (stems, flowers and
sliques. The vector is RRL's lambda Zip-Lox. The CDNA
inserts were directionally cloned with Sal-Not arms using
oligo dr primed CDNA.

Proteins and nucleic acids associated with Alzheimer's disease - related conditions.

Trelated conditions, hyperilopproteinaemia or cardiovascular disease and used to develop products for diagnosis of Alzheimer's disease and used to conditions, hyperilopproteinaemia or cardiovascular disease claim 13; Pig 6A; 67pp; Engilsh.

2 open reading frames (T18068 and T18069) identified in the apolioporotein E (ApoE) antisease sequence code for proteins apoBLL (R2213) and apoBLL (R32114), respectively. Both OREs are transcribed from an upstream regulatory region (T18074).

C are transcribed from an upstream regulatory region (T18074) compline to form a hybrid ORE, ApoE4LLX (T18070).

C the significance of these and other sequences (see also T18065-77) in the actiology of Alzheimer's disease (AA) provides means for diagnosing AD and related diseases, for the design of therapeutic tengents (e.g. ribozymes or antibodies) and potentially for gene 305 GAGCGCGCCTCAGCGCCATCCGCGAGCGCCTGGGGGCCCTGGTGGAACAGGGCCGGTG 246 Gaps 6 GACTICAGIGICICCICCATCCCAGGAGCGCAGIGGCCACIAIGGGGICIGGGCIGCCCC 65 100-UN-1996 (first entry)

```
Prodn. of recombinant apo:lipoprotein E in insects - by infecting Handuca sexta larvae with recombinant Autographica californica and Handuca sexta larvae with recombinant Autographica californica or nuclear polyhedrosis baculovitus vector.

Profice of Columns 11-14; 10pp: English.

Recombinant human apolipoprotein-E (ApoE) (R86791) can be produced Recombinant human apolipoprotein-E (ApoE) (R86791) can be produced construct (confg. an ApoE-encoding sequence, by preparing a genetic construct (confg. an ApoE-encoding sequence of e.g. 106957, and flanking regulatory sequences enabling the protein conformation of the apolitical and an insect cells), which is then introduced into a conformation of conclear polyhedrosis virus) and recombinant Autographica californica hademolymph of the larval host. The ApoE produced is in a form chaemolymph of the larval host. The ApoE produced is in a form cannot be actieved in insect cell cultures, and can therefore be consed in therpeutic applications:

polylinker; site_1: Not I; Site_2: Eco Ri; The UI-R-C2p
library is a subtracted library derived from the U-R-C1
library, which is a subtracted library derived from the
UI-R-C0 library. The UI-R-C0 library consisted of a
mixture of individually tagged normalized libraries
constructed from rat placenta, adult lung, brain, liver,
embryo. The tag is a string of 3-5 nucleotides present
between the Not I site and the oligo-dT track which allows
the mixture. The subtracted library of origin of a clone within
constructed as follows: PCR amplified obna inserts from
UI-R-C1 clones from of single-stranded circles; The
remaining single-stranded circles and electroporated
UI-R-C2P library in the form of single-stranded circles and electroporated
unconverted to double-stranded circles and electroporated

On Jul 27, 1999 this sequence version replaced gi:5579004.

On Jul 27, 1999 this sequence exerations:
Furing sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations annotation name. Note that the together with a note of the overlapping clone, as we submit sequence submission variation annotation may not be found in the sequence submission.

The following abbreviations are used to associate primary accession rumbers given in the feature table with their source databases: numbers given in the feature table with their source databases: numbers given in the feature table with their source databases: numbers given in the feature table with their source databases on the WORMPEP; Information has been finished according to sequence map criteria as follows. An has been finished according to sequence map criteria as follows. An has been finished according to sequence map criteria as follows. An extempt 1s made to resolve all sequencing problems, such as attempt and repeats, but not necessarily within known compressions and repeats, but not necessarily within known sequence agequence thements (e.g. Alu). Where the sequence sequence is an annotation using the 'unsure' sequence as an annotation using the 'unsure' sequence and annotation and the 'unsure' sequence and annotation and the 'unsure' sequence and annotation and the 'unsure' sequence and annotation using the 'unsure' sequence and annotation and the 'unsure' sequence and annotation and the 'unsure' sequence and annotation and the 'unsure' sequence a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HSJ858B16 36676 bp DNA B58B16 on chromosome 12. Contains the Human DNA sequence from clone 858B16 on chromosome 12. Contains the KIAAO542 gene and a gene for a novel protein similar to hamster pssc. (Phosphetidylserine Decarboxylase Proenzyme, EC 4.1.1.65). ALO96768 and a putative CpG island, complete sequence. ALO96768 1 G1:5596770 HTG: CpG Island; KIAAO542; Phosphatidylserine Decarboxylase Proenzyme; PSSC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VICTILFIALSGNACVILALRTTRHKISRLFFKKKLSTADLVVAVPQVLPQLLMDIT

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence has been validated by Multiple Complete Digest
Mapping. Comparison of the experimentally derived map digest
fragments with sequence-predicted fragments is given below.
Small fragments below a variable cutoff (approximately 400-600bp)
are not mapped and hence do not appear in the table. There are no
significant remaining discrepancies between the experimental and
predicted values. Uniquely ordered fragment groups are separated
by dashed lines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence Quality Assessment:
This entry has been annotated with sequence quality
estimates computed by the Phrsp assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the Genbank flat file format but are available as part
of this entry's ASN.1 file.

CB10 11, 1999 this sequence version replaced gi:4014529.

During sequence assembly data is compared from overlapping clones
Where differences are found these are annotated as variations

Variation anotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences

only a small overlap as described above.

The following abbreviations are used to associate primary accession

numbers given in the feature table with their source databases:

Em; EMB1; Sw; SWISSPROT; Tr; TRENEL

This sequence has been finished according to sequence map criteria

as follows. An attempt is made to resolve all sequencing problems,

such as compressions and repeats, but not necessarily within known

sequence is ambiguous, there is an annotation using the 'unsure'

meature key.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 human chromosome 22, constructed by the Sanger Centre Chromosome 22 http://www.sanger.ac.uk/MED/Chr22
SJN18 is from the library RPCI4 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/ VECTOR: prPRAC2
IMPORTANT: This sequence is not the entire insert of clone 591N18.
It may be shorter because we arrange for a small overlap between neighbouring submissions.
The true left end of clone 229A8 (186090) is at 97475 in this sequence. The true right end of clone 129A8 (186090) is at 97475 in this sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Direct Submission

Direct Submission

Direct Submission

Submitted (26-JUL-1999) Sanger Centre, Hinxton, Cambridgeshire,

CB10 1SA, Uw. E-mail enquiries: hunqueryssanger.ac.uk Clone
requests: clonerquest@sanger.ac.uk

On Jun 29, 1999 this sequence version replaced gl:552835,

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission

orresponding to the overlapping clone, as we submit sequences with

only a small overlap as described above.

The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:

Em: FEML: W.: SWISSPROT: TT:, TREMBL

This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 human chromosome 22, constructed by the Sanger Centre Chromosome 22 http://www.sanger.ac.uk/RGP/Chr22
402611 is from the 11brary RPCI3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jons For further details see http://bacpac.med.buffalo.edu/ VECTOR: pCrPAC2 This sequence is the entire insert of clone 402611. The true right end of clone 232217 is at 56734 in this sequence. The true right end of clone 89814 is at 23403 in this sequence. The true right end of clone 600024 is at 96013 in this sequence.

* NOME: This is a "working draft' sequence. It currently

* consists of 139 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo. 1 (bases 1 to 303319) 830: contig of 830 bp in length 1660: contig of 830 bp in length 2498: contig of 838 bp in length 3378: contig of 838 bp in length 4616: contig of 878 bp in length 4616: contig of 787 bp in length 6430: contig of 877 bp in length 6330: contig of 877 bp in length 6330: contig of 872 bp in length 6411: contig of 1011 bp in length 6411: contig of 727 bp in length 1020: contig of 805 bp in length 1171: contig of 734 bp in length 1172: contig of 734 bp in length 1173: contig of 734 bp in length 1173: contig of 734 bp in length 1173: contig of 735 bp in length 1335: contig of 737 bp in length 1335: contig of 578 bp in length AC006927.19 GI:6091655 HTG; HTGS_PHASE1. CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the

ANNOTATION OF FEATURES:

Features listing

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage. DUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DRA encoding coxsackie virus and adenovirus receptor - useful for modulation of e.g. cardiac, pancreatic or gastrointestinal infection by DRA encoding coxsackie virus and adenovirus and secure; Fig 14; 104pp; English.

The present sequence encodes mouse coxsackievirus and adenovirus consciours; Fig 14; 104pp; English.

The present sequence encodes mouse coxsackievirus and adenovirus considered represent invention also describes: (1) a method for modulates CAR protein activity or CAR nucleic acid expression, which modulates CAR protein activity or CAR nucleic acid expression, associated activity of the cell in the absence of the agent; and (2) a method for detecting the presence of CAR in a biological sample comprising contacting a biological sample with an agent capable of detecting CAR protein or mRNA such that the presence of CAR is detected.

COMPATISING contacting a biological sample with an agent capable of detecting CAR protein or mRNA such that the presence of CAR is detected.

COMPATISING contacting a biological sample with an agent capable of confluction of CAR is useful for treatment of cardiac infection, e.g. myocarditis, pericarditis or dilated cardiomyopathy, or infection of the central nervous system, e.g. a non-specific febrila lilinose or infection of the respiratory or gastrointestinal tract or childhood onset diabetes mellitus. Probes derived from CAR nucleic acids are useful for hybridisation assays, and antibodies raised against CAR include combining CAR protein and candidate/test compound are useful in sequence liles BP; 297 A; 1286 C; 288 G; 257 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                          03-AUG-1998 (first entry)
Mouse coxsacklevirus and adenovirus receptor encoding DNA.
Mouse, coxsacklevirus, adenovirus; receptor; CAR, cardiac infection;
myocarditis; pericarditis; dilated cardiomyopathy; meningoencephalitis;
panoreatic infection; acute pancreatitis; gastrointestinal tract;
diabetes mellitus; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 3

This cobs molecule codes for mouse MCAR protein (see W69699) that serves as cellular receptor for adenoviruses of the serotypes 2 and 5 (subgroup C) and for the group B coxsackieviruses (CVB). It was obtained by screening a lambda phage expression cDNA ilbrary with antiserum containing antibodies specific for mouse CVB binding protein p46, and was used to identify human HCAR CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-DEC-1998 (first entry) Mouse coxsacklevirus and Ad2 and Ad5 receptor (MCAR) cDNA. (see V50429). The invention also provides host cells transformed with DNA molecules encoding HGAR or MGAR and methods of producing the recombinant proteins or their derivatives. These proteins, their extracellular domains, as well as oligopeptides (see W69699-708) which bind virus, are also provided. Isolated HGAR or MGAR proteins or their fragments or variants are used to prevent or treat virus infections. Expressing the DNA in cells which lack these viral receptors renders the cells susceptible to transformation by adenoviral vectors carrying genes for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

Human and rat-derived brain-specific adaptor polypeptide FC99 - is involved in neuron signal transmission and is useful in diagnosis and rat-derived brain-specific adaptor in diagnosis and treatment of neurological diseases e.g. Alzheimer's dementia and treatment of neurological diseases e.g. Alzheimer's dementia and reatment of neurological diseases e.g. Alzheimer's dementia and claim 4; Pages 22-23; 42pp; Engilsh.

A cDNA clone (766986) codes for FC99 (W15256), a novel brain-specific adapter molecule involved in neuron signalling pathways.

It was obtd. from a normalised cDNA library prepd. from human cerebrum-derived mRNA. 5'-Terminal sequences of plasmid inserts in E. coll transformants were sequenced and translated amino acid corebrain cortex), was selected. Sequencing revealed RC99 (FC - forebrain cortex), was selected. Sequencing revealed alternative, in-frame initiation points of translation, providing coding sequences of 1425 bases (T66883) and 1785 bases (T66886). FC99 culcied acids (including antisense) and polypeptides can be used to study phosphorylated tyrosine-mediated intracellular signalling pathways in diagnosis and treatment of neurological diseases and cortext diagnosis/treatment methods or reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

14 From an ADP Tibosylation factor gene of a plant
15 Claim 3; Page 7-9; J4pp: Bagglish.
16 Abarley ADP Tibosylation factor (ARF) gene was isolated by differential screening of cDNA libraries prepd. from barley roots and leaves. The regulatory (promoter) region of the gene was identified and sequenced (T05628). This region has been incorporated into and sequenced (T05628). This region has been incorporated into express genes in a tissue-specific, efficient manner for use in plant breeding or the prodn. of substances using plant tissues or cells.

                                                                                                                                                             Claim 3; Page 28-30; 46pp; English.

The sequence encodes human growth factor Wnt-10b, and has been isolated from a fetal bone marrow stroma cell CDNA library by PCR isolated from a fetal bone marrow stroma cell CDNA library by PCR isolated from a fetal bone marrow stroma cell cDNA library by PCR isolated for sequences within the Wnt gene family, followed by use of the amplified fragment as a probe and chromosome walking for isolation of the full-length sequence. A truncated sequence, Wnt-10b-delta, is given in 149319 (Claim 3). A plasmid containing the Wnt-10b cDNA has been deposited as Arcc 97208. Antibodies and antisense sequences corresponding to Wnt-10b may be used as pharmaceuticals, and Wnt-10b may be used in a culture medium for ex vivo haematopoietic stem cell culture for use e.g. in gene therapy. Fragments of the gene may be used as claquostic probes or primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      10-OCT-1995 (first entry)

has mitogenic and/or differentiation inducing properties useful in the treatment or prevention of diseases of bone, cartilage, connective tissue, skin, mucosa, epithelium or dental tissue. The protein can also be used for wound healing and tissue regeneration e.g. in osteoporosis and arthritis.
                                                                                                                                                                                                                                                                                                                                  2449 GCCCACCATTCTCCTCACCTGGGCCTTCTCACCTCTGGACTCTCCTAAGCACTCTCA 2508

Claim 10; Fig 1: 34pp: English.

Claim 10; Fig 1: 34pp: English.

The sequence encodes human articular cartilage-derived morphogenetic protein-1 (CDMP-1). Primers T13603-06, constructed from conserved motifis from bone morphogenetic protein, have been used in reverse transcription-polymerase chain reaction amplification of a cattle articular chondrocyte cDNA library, generating products of 120 and 280 bp, which are then used to screen a human articular cartilage CDNA library. Colne lacking the N-terminal region has been isolated, and used to obtain a full-length genomic clone.

CDMP-1 is present in a purified cartilage extract (claimed) which
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                    13 GGCCACTATGGGGTCTGGGCTGCCCCTTGTCCTCTTGACCCTCCTTGGCAGCTCACA 72

Page 12-15; 26pp; English engine of promoting bone regrowth a cDNA fragment in plasmid pMSS99 (T59729) codes for novel human bone morphogenic factor MP52 Arg (W12770), a growth factor that induces formatings from undifferentiated mesenchymal cells and which stimulates the differentiation and maturation of osteoblasts. Plasmid pSK52s was digested with Hindill, and the isolated DNA fragment (config. cDNA comprising the compilete region for MP52 Arg) was inserted into vector pABStop to give pMSS99. This expression vector can be used to produce MP52 Arg in host
stimulates local cartilage formation and repair when combined with a matrix and implanted in a mammal. The protein may be used in therapy of e.g. chondromalacia or osteoarthritis, to heal joint surfaces, or to repair cartilage after reconstructive surgery. Sequence 2341 BP; 523 A; 688 C; 683 G; 447 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes the human MP52 protein, which is described in W0 9316099 and 9504819 as a member of the human transforming growth factor beta superfamily. Active MP52 can be used in a medicament to treat and prevent nervous system diseases, and/or to treat neuropathological conditions caused by nervous system againg.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, Application US/08469658
Patent No. 5917018
GENERAL INFORMATION:
FAPLICANT: Th egersen, Hans Christian
APPLICANT: Holtet, Thor Las
APPLICANT: Etzerodt, Michael
TITLE OF INVENTION: IMPROVED METHOD FOR THE REFOLDING OF
TITLE OF INVENTION: PROTEINS
NUMBER OF SEQUENCES: 58
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 15.9%; Score 28.6; DB 2; Length 1: Best Local Similarity 49.0%; Pred. modified pOlylinker; lst strand cDNA was prepared from
pooled lung tumor tissue, and was then primed with a Not I
- oligo(dT) primer. Double-stranded cDNA was ligated to
Eco RI adaptors (Pharmacia), digested with Not I and
cloned into the Not I and Eco RI sites of the modified
pT/T3 vector. Library went througb one round of
normalization. Library constructed by Bento Soares and M.
Fatima Bonaldo.

mixture of individually tagged normalized libraries maxture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18 day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UTR-C2D) was constructed as follows: PCR amplified cDNA inserts from UTR-C1 clones from which 3' ESTs had been derived was used as a driver in a hybridization with the UTR-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DHIOB bacteria (Life Technologies) to generate the UTR-C2 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oryza sativa

// Is Strand CDNA was primed with a Nct I - oligo(dT)15 primer

// Is pranded CDNA was ligated to Sal I adaptors (BRL),

digested with Nct I and cloned into the Nct I and Sal I

sites of the pSPORTI Vector (BRL). Library was constructed

by Matthew Clark (Lehrach lab; ICRF, London and Max Planck

Institut fuer Molekulare Genetik, Berlin). CDNAs for EST

analysis were selected following oligonucleotide

hybridization ingerprinting of arrayed clones from

abrafish late somitogenesis (26 ss), adult liver or

embryonc shield steps (5.6 h) libraries. Fingerprint

deta were used to computationally cluster cDNAs, and a

single CDNA from each cluster was chosen for sequencing.

In some cases multiple members of the same cluster were

sequenced to assess clustering parameters or single clones

were sequenced additional times to assess quality
